

StyleSense Analytics

Executive Report

Business Scenario

StyleSense is a multi-category fashion retailer experiencing healthy overall sales. Management wants to understand whether current sales performance is sustainable by evaluating inventory availability, seasonal demand, promotional effectiveness, and product performance. The objective is to identify opportunities to improve inventory planning, merchandising, and promotional strategy using data-driven insights.

Business Problem Statement

The business lacks a consolidated analytical view of sales, inventory, customer demand, and promotional performance. Without these insights, high-demand products may experience stock-outs, seasonal demand may not be forecast accurately, and marketing investments may not generate maximum returns.

Project Objective

- Build a clean analytical data model using Power Query and Power Pivot.
- Develop business KPIs using DAX measures.
- Analyze sales, inventory, seasonality, campaigns, and product performance.
- Provide actionable recommendations for business decision-making.

Business Questions Answered

- Which product categories generate high revenue despite low inventory?
- How do monthly sales and customer demand change throughout the year?
- Which promotional campaigns and discount strategies generate the highest business impact?
- Which products perform best across different seasons?

Overall Insights

- Sales performance remained consistently strong throughout the year with only moderate seasonal fluctuations.
- Men, Kids, and Women's Ethnic categories generated strong revenue and should remain priority product segments.

- Several high-revenue categories operate with relatively low inventory, indicating potential stock-out risk.
- August emerged as the strongest sales period, while Winter and Monsoon showed the highest seasonal product demand.
- Festive Blast and Weekend Rush campaigns delivered the strongest business impact.
- Percentage-based promotions generally outperformed other discount strategies.
- Different products lead in different seasons, highlighting the importance of seasonal merchandising.
- Revenue trends closely followed order volume, indicating that sales growth was primarily demand-driven.

Overall Business Recommendations

- Increase replenishment frequency for high-demand, low-stock categories.
- Forecast inventory using seasonal demand patterns before peak months.
- Allocate larger marketing budgets to high-performing promotional campaigns.
- Optimize weaker product categories through assortment and pricing reviews.
- Adopt season-specific merchandising instead of maintaining a uniform product mix.
- Continue monitoring KPIs through automated Power Query refreshes and DAX-based reporting.
- Use this analytical framework as a monthly business performance review process.

Business Value Delivered

This project demonstrates practical business analytics by transforming raw retail data into decision-ready insights. It showcases skills in data cleaning, data modelling, DAX, KPI development, PivotTables, business storytelling, and recommendation-driven analysis suitable for an entry-level Data Analyst portfolio.
